

# Online Quiz System

## Abstract

The Online Quiz System automates quiz creation, participation, evaluation, and result generation. It allows users to register, log in, attempt multiple-choice quizzes, and receive instant scores. Administrators can manage questions and monitor performance using a MySQL database.

## Objectives

- Provide an online quiz platform.
- Automate evaluation and result generation.
- Reduce manual effort.
- Ensure secure authentication.
- Manage question banks efficiently.
- Provide instant feedback.

## Tools and Technologies Used

Programming Language: Java  
Frontend: HTML, CSS, JavaScript  
Backend: Java (JDBC/Servlets)  
Database: MySQL  
IDE: Eclipse/IntelliJ/NetBeans  
Server: Apache Tomcat  
Version Control: Git and GitHub

## Dataset

The database contains Users, Questions, and Results tables. Questions include multiple-choice options and correct answers from programming, aptitude, DBMS, operating systems, and computer networks.

## Methodology

Requirement Analysis → System Design → Database Design → Application Development → Integration → Testing → Deployment.

## Expected Results

Secure login, online quiz participation, automatic score calculation, instant results, administrator management, accurate record storage, and improved assessment efficiency.

## Conclusion

The Online Quiz System provides a reliable and scalable platform for conducting digital assessments. It reduces manual work, improves accuracy, and offers immediate feedback, making it suitable for educational institutions and training organizations.
